

Ninad Rajendra Rade

radeninad@gmail.com | linkedin.com/in/ninadrade | github.com/ninadrade | New York, USA (F-1, CPT/OPT Eligible)

Education

New York University, Tandon School of Engineering M.S. Computer Engineering, GPA: 3.667/4.0	Expected May 2027
University of Mumbai – FCRIIT B.E. Computer Engineering, Honors in AI & ML, CGPA: 8.97/10 <i>Coursework: Machine Learning, Deep Learning, Artificial Intelligence, Data Structures & Algorithms, Database Management Systems</i>	Jul 2025

Skills

Programming: Python, SQL, C/C++, Bash
AI & ML: Scikit-learn, Classification, Regression, Feature Engineering, Hyperparameter Tuning, Cross-Validation, SMOTE, Agentic Systems
Deep Learning & NLP: TensorFlow, LSTM, Neural Networks, NLTK, TF-IDF, Text Classification, LLM API Integration
Evaluation: Precision, Recall, F1-Score, ROC-AUC, MAE, RMSE
Tools: Pandas, NumPy, Matplotlib, Seaborn, Git, Jupyter Notebook, MySQL, MongoDB, AWS S3, Firebase, Linux

Experience

Software Data Intern (Healthcare AI Systems), DavaNinja Pvt. Ltd. – Mumbai, India	Oct 2024 – Mar 2025
- Engineered modular Python pipelines using NLP techniques to clean and standardize large-scale pharmacy datasets, producing structured inputs for supervised ML model development - Implemented automated schema validation and statistical consistency checks for missing values and data drift, reducing manual review effort by 40–50% and improving downstream model reliability - Transformed heterogeneous healthcare records into consistent feature sets via rule-based parsing and statistical selection, enabling reproducible model training across classification workflows	
Junior Executive → Organizing Committee VP, AIESEC in India – Mumbai, India	May 2022 – Aug 2022
Developed Python automation scripts to standardize reporting workflows, reducing manual overhead while coordinating programs for 50+ participants	

Projects

AI-Powered Spam Email Classifier	Python, Scikit-learn, NLTK, OpenAI API
- Built NLP preprocessing pipeline (tokenization, stopword removal, TF-IDF) and trained Naive Bayes, Logistic Regression, and SVM classifiers, optimizing for F1-score to minimize false negatives - Integrated OpenAI API as an intelligent fallback for ambiguous classifications, combining classical ML with LLM reasoning in a production-style agentic decision pipeline	
Heart Disease Risk Prediction	Python, Scikit-learn
- Constructed end-to-end classification pipeline covering EDA, SMOTE-based imbalance handling, and comparison of Logistic Regression, Random Forest, and SVM using precision, recall, F1, and ROC-AUC - Analyzed feature importance and decision boundaries to surface interpretable clinical risk indicators for explainable AI in healthcare decision support	
Stock Market Prediction with LSTM	Python, LSTM, NumPy
Designed LSTM network with rolling-window feature engineering and temporal train/test split to prevent data leakage; optimized window sizes using MAE and RMSE to improve generalization across market conditions	
Pharmacy Data Structuring Framework	Python, SQL
Built scalable multi-stage preprocessing pipeline with ingestion, validation, transformation, and output modules; implemented schema validation to reduce null propagation for ML ingestion	
Task Manager CLI Application	Python, SQLite, Git
Built terminal-based task manager supporting CRUD, priority filtering, and due-date tracking with persistent SQLite storage; structured using OOP with separate modules for CLI, database, and business logic	
ESP32-CAM Surveillance System	C++, Firebase
Developed motion-triggered image capture using ESP32-CAM and IR sensors with interrupt-based handling; designed edge-to-cloud pipeline to Firebase with false-trigger suppression logic
