radeninad@gmail.com | linkedin.com/in/ninadrade | github.com/offninad | offninad.github.io | New York, USA

EDUCATION

New York University, Tandon School of Engineering

Expected May 2027

M.S. Computer Engineering, GPA: 3.667/4.0

University of Mumbai – FCRIT

Jul 2025

B.E. Computer Engineering, Honors in AI & ML, CGPA: 8.97/10

Coursework: Machine Learning, Deep Learning, Artificial Intelligence, Big Data, Data Structures & Algorithms, Database Management Systems

SKILLS

Programming: JavaScript, React, Node.js, Python, SQL, C/C++, Bash

AI & ML: Scikit-learn, Classification, Regression, Feature Engineering, Hyperparameter Tuning, Cross-Validation, SMOTE, Agentic Systems

Deep Learning & NLP: TensorFlow, LSTM, Neural Networks, NLTK, TF-IDF, Text Classification, LLM API Integration

Big Data: Apache Spark, PySpark, Spark SQL, Spark MLlib, Distributed Processing, Parquet, Streamlit

Evaluation: Precision, Recall, F1-Score, ROC-AUC, MAE, RMSE

Tools: Pandas, NumPy, Matplotlib, Seaborn, Git, Jupyter Notebook, MySQL, MongoDB, AWS S3, Firebase, Linux

EXPERIENCE

Software Engineering Intern

Oct 2024 – Mar 2025

DavaNinja Pvt. Ltd., Mumbai, India

- Engineered modular Python pipelines using NLP techniques to clean and standardize 100K+ pharmacy records, producing structured inputs for supervised ML model development
- Implemented automated schema validation and statistical consistency checks, reducing manual review effort by 40–50% and improving downstream model reliability
- Integrated REST APIs to fetch and transform JSON data across 3 internal services, unblocking a 2-week pipeline bottleneck and enabling automated data ingestion into classification workflows
- Authored and executed 40+ manual test cases for pre-release mobile builds, documenting reproducible bugs and cutting QA review cycles by 30% before each production push

Junior Executive → Organizing Committee VP

May 2022 – Aug 2022

AIESEC in India, Mumbai, India

- Automated reporting workflows using Python scripts to standardize processes, reducing manual overhead while coordinating programs for 50+ participants

PROJECTS

NYC Taxi Demand Prediction & Anomaly Detection | Python, PySpark, Spark SQL, Spark MLlib, Streamlit

GitHub

- Engineered end-to-end PySpark pipeline ingesting ~10M NYC TLC Yellow Taxi trip records (~150MB Parquet); processed 8.8M cleaned trips in under 3 minutes on a 4-core Spark cluster using broadcast joins and DataFrame caching to cut zone-lookup join time from 45s to under 5s
- Trained Spark MLlib Linear Regression and Random Forest demand-forecasting models at (date, hour, pickup-zone) granularity across ~420K buckets; Random Forest achieved RMSE 41.35 and R^2 0.69, a 4x R^2 improvement over the Linear Regression baseline
- Designed hybrid anomaly detector combining rule-based filters (impossible speed, extreme fare/duration) and IQR statistical bounds to surface ~14% of trips, and shipped a Streamlit dashboard for interactive temporal and spatial demand exploration without re-running Spark

Finance Management System | JavaScript, React, Node.js, MongoDB, REST APIs

GitHub

- Shipped a full-stack MERN web application with JWT-based authentication, role-based access control, and real-time dashboard for multi-user financial tracking across 5+ account types
- Architected RESTful API layer with 12+ endpoints covering transaction CRUD and account aggregation, reducing average query response time by 35%

AI-Powered Spam Email Classifier | Python, Scikit-learn, NLTK, OpenAI API

GitHub

- Constructed NLP preprocessing pipeline (tokenization, stopword removal, TF-IDF) and trained Naive Bayes, Logistic Regression, and SVM classifiers, achieving 97%+ F1-score to minimize false negatives
- Integrated OpenAI API as an intelligent fallback for ambiguous classifications, combining classical ML with LLM reasoning in a production-style agentic decision pipeline

Heart Disease Risk Prediction | Python, Scikit-learn

GitHub

- Built end-to-end classification pipeline with SMOTE-based imbalance handling; Random Forest achieved 89% ROC-AUC across Logistic Regression, Random Forest, and SVM comparison
- Analyzed feature importance to surface interpretable clinical risk indicators, reducing the feature set from 13 to 7 variables for explainable AI in healthcare decision support

Stock Market Prediction with LSTM | Python, TensorFlow, NumPy

GitHub

- Constructed an LSTM network with rolling-window feature engineering and temporal train/test split to prevent data leakage; optimized window sizes using MAE and RMSE, reducing prediction error by 18% over baseline

CERTIFICATIONS

Software Engineer Intern | HackerRank

Credential | 2026

Generative AI Fundamentals | Databricks

Credential | 2026
